
FASTPCARD

Case: 1926 New Optional Configuration - Manually Self Assess Tax

The self-assess option can be enabled/disabled. With self-assess option on, the tax input is disabled and the amount is automatically added to the total.

Case: 2374 FASTPCARD - Net does not recalculate after tax change

This feature works as intended. No changes made.

Case: 2377 Update vwpcard_commitments to get name for banner id

Edit Transactions page now shows Card Holders first and last name when there are no current transactions.

Case: 2538 Limit posting validation on transaction posted date

PCard batch post verification now checks history table for posted date in addition to transaction ID and transaction date

Case: 2539 Allow posting of batches with more than 9,999 records

PCard batches which are posted to Banner can have self assessed taxes and tax rebates added to them. This means for each line there could be up to 10 line items being posted (theoretically). If there are 3000 PCard transactions being posted then over 9,999 line items might end up in Banner which GURFEED is not able to process. We have removed this limitation by splitting the batch into smaller chunks (if we detect that there will be too many transactions). There could therefore be more than one batch ID returned after posting if too many transactions. If the batch is split into multiple batches the system will always ensure that the batch is split at the change point between card numbers. i.e. transactions on a specific card will never be split across multiple batches.

Case: 2603 Co-ordinator column missing from Cardholder Administration page

Co-ordinator column displays and all columns line up with the heading.
